

# **Microdata and schema.org**

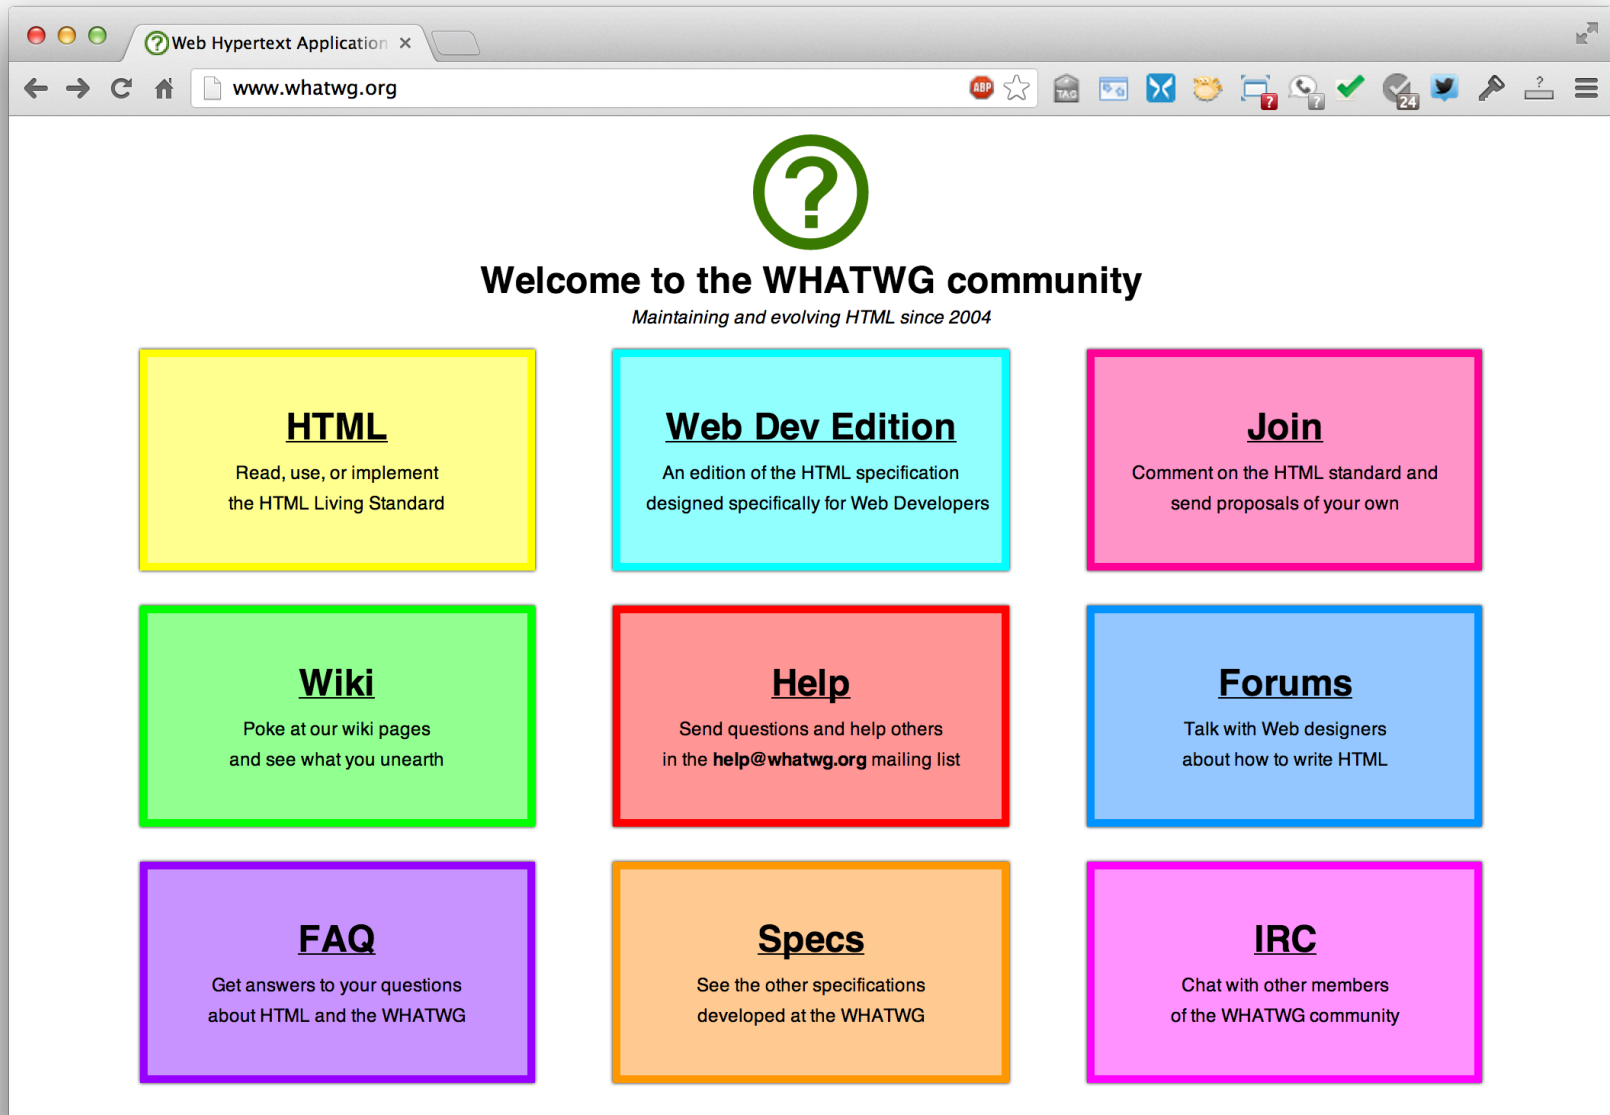

# Basics

- Microdata is a simple semantic markup scheme that's an alternative to RDFa
- Developed by WHATWG and supported by major search companies (Google, MSFT, Yahoo)
- Like RDFa, it uses HTML tag attributes to host metadata
- Vocabularies are controlled and hosted at [schema.org](http://schema.org)

# What is WHATWG?

- Web Hypertext Application Technology Working Group
  - Community interested in evolving the Web with focus on HTML and Web API development
  - Ian Hickson is a key person, now at Google
- Founded in 2004 by individuals from Apple, Mozilla and Opera after a W3C workshop
  - Concern about W3C's embrace of XHTML
- Current work on HTML5
- Developed Microdata spec

# http://whatwg.org/

The image shows a browser window with the URL [www.whatwg.org](http://www.whatwg.org). The page features a large green question mark icon at the top center. Below it, the text reads "Welcome to the WHATWG community" and "Maintaining and evolving HTML since 2004". The page is organized into a 3x3 grid of colored boxes, each containing a link and a brief description:

<b><u>HTML</u></b> Read, use, or implement the HTML Living Standard	<b><u>Web Dev Edition</u></b> An edition of the HTML specification designed specifically for Web Developers	<b><u>Join</u></b> Comment on the HTML standard and send proposals of your own
<b><u>Wiki</u></b> Poke at our wiki pages and see what you unearth	<b><u>Help</u></b> Send questions and help others in the <a href="mailto:help@whatwg.org">help@whatwg.org</a> mailing list	<b><u>Forums</u></b> Talk with Web designers about how to write HTML
<b><u>FAQ</u></b> Get answers to your questions about HTML and the WHATWG	<b><u>Specs</u></b> See the other specifications developed at the WHATWG	<b><u>IRC</u></b> Chat with other members of the WHATWG community

# HTML5

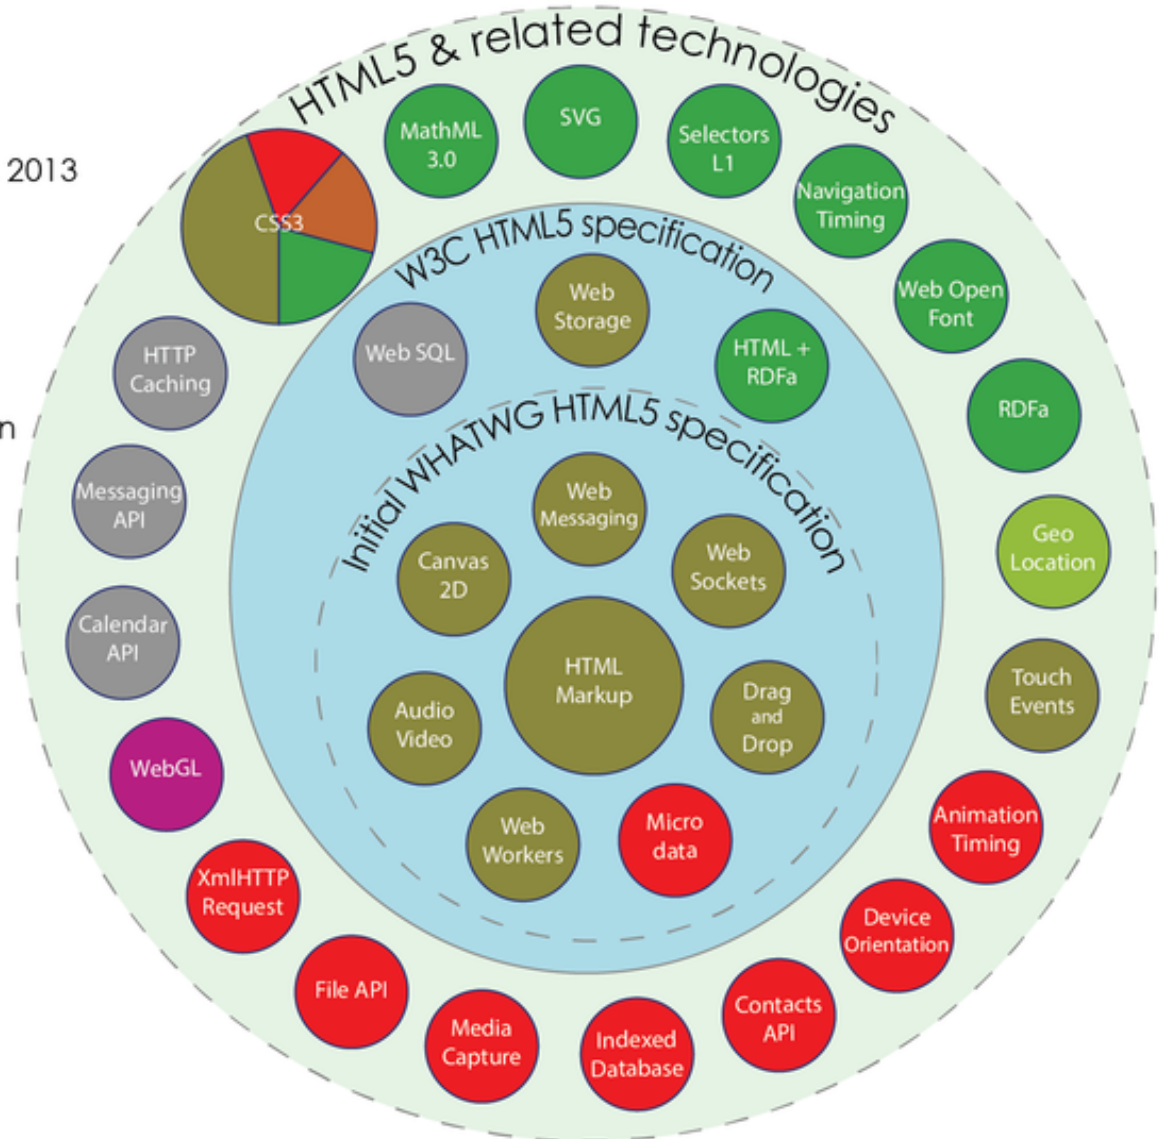

- Started by WHATWG as an alternative to XHTML, joined by W3C
  - A W3C candidate recommendation in 2012
  - WHATWG will evolve it as a “living standard”
- HTML5  $\approx$  HTML + CSS + js
- Native support for graphics, video, audio, speech, semantic markup, ...
- Partial support in current browsers + extensions

# HTML taxonomy and status

## HTML5

Taxonomy & Status on January 20, 2013

- W3C Recommendation
- Proposed Recommendation
- Candidate Recommendation
- Last Call
- Working Draft
- Non-W3C Specifications
- Deprecated

# Microdata

- The microdata effort has two parts: markup and a set of vocabularies
- The markup is similar to RDFa in that it provides a way to identify subjects, types, properties and objects
- The sanctioned vocabularies are found at [schema.org](http://schema.org) and include a small number of very useful ones: people, movies, etc.

# An example

```
<div>  
  <h1>Avatar</h1>  
  <span>Director: James Cameron (born 1954) </span>  
  <span>Science fiction</span>  
  <a href="avatar-trailer.html">Trailer</a>  
</div>
```

# An example: itemscope

- An *itemscope* attribute identifies a content subtree that is the subject about which we want to say something

```
<div itemscope >  
  <h1>Avatar</h1>  
  <span>Director: James Cameron (born 1954) </span>  
  <span>Science fiction</span>  
  <a href="avatar-trailer.html">Trailer</a>  
</div>
```

# An example: itemtype

- An *itemscope* attribute identifies a content subtree that is the subject about which we want to say something
- The *itemtype* attribute specifies the subject's type

```
<div itemscope itemtype="http://schema.org/Movie">  
  <h1>Avatar</h1>  
  <span>Director: James Cameron (born 1954) </span>  
  <span>Science fiction</span>  
  <a href="avatar-trailer.html">Trailer</a>  
</div>
```

# An example: itemprop

- An *itemscope* attribute identifies a content subtree that is the subject about which we want to say something
- The *itemtype* attribute specifies the subject's type
- An *itemprop* attribute gives a property of that type

```
<div itemscope itemtype="http://schema.org/Movie">  
  <h1 itemprop="name">Avatar</h1>  
  <span>Director: James Cameron (born 1954) </span>  
  <span itemprop="genre">Science fiction</span>  
  <a href="avatar-trailer.html" itemprop="trailer">Trailer</a>  
</div>
```

# An example: embedded items

- An itemprop immediately followed by another itemscope makes the value an object

```
<div itemscope itemType="http://schema.org/Movie">
  <h1 itemprop="name">Avatar</h1>
  <div itemprop="director"
    itemscope itemType="http://schema.org/Person">
    Director: <span itemprop="name">James Cameron</span>
    (born <span itemprop="birthDate">1954</span>) </div>
    <span itemprop="genre">Science fiction</span>
    <a href="avatar-trailer.html" itemprop="trailer">Trailer</a>
  </div>
```

# schema.org vocabulary

- Full type hierarchy in [one file](#)
- As of 4/23/13: 419 classes, 756 properties
- **Data types:** Boolean, Date, DateTime, Number (Float, Integer, Text (URL), Time
- **Objects:** Rooted at Thing with two 'metaclasses' (Class and Property) and eight subclasses

## Data Type

Boolean

Date

DateTime

Number

Float

Integer

Text

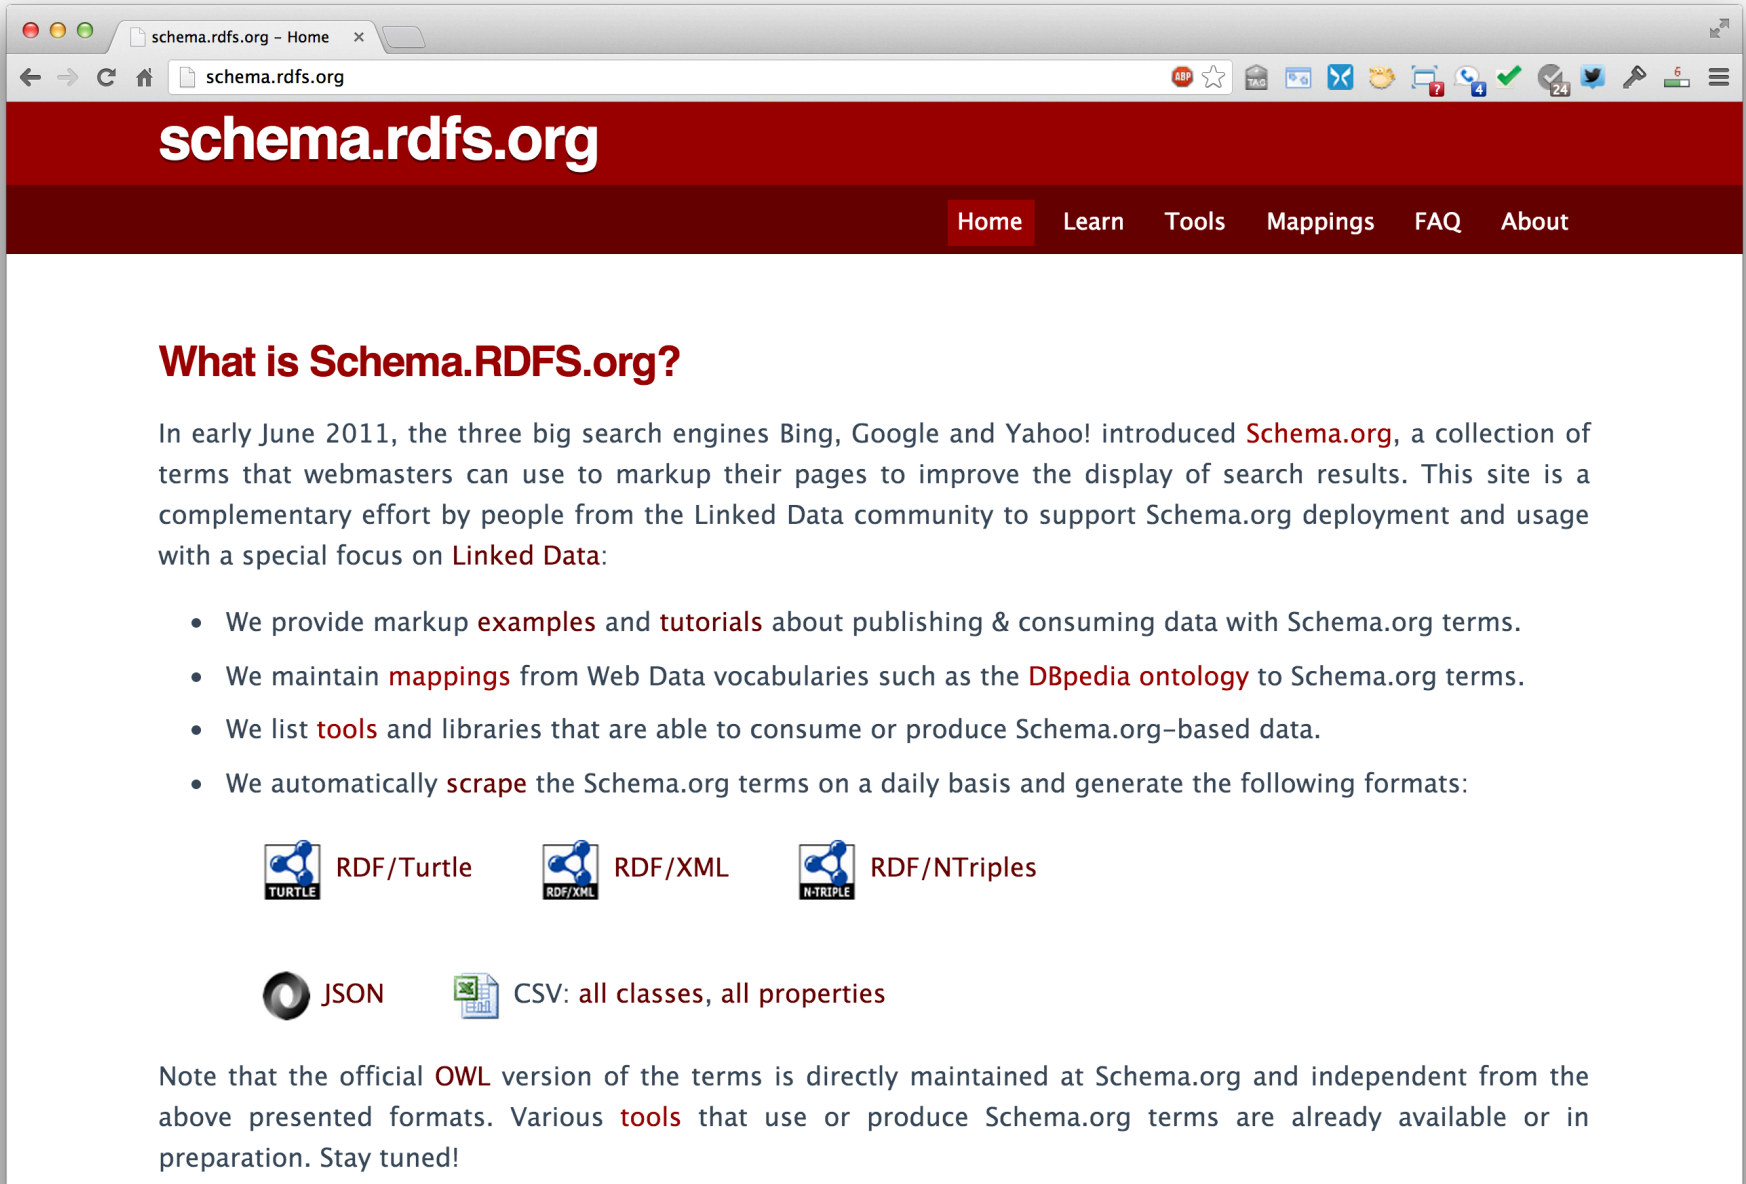

URL

Time

## More specific types

- Class
- CreativeWork
- Event
- Intangible
- MedicalEntity
- Organization
- Person
- Place
- Product
- Property

# <http://schema.rdf.org>

The screenshot shows a web browser window with the address bar containing 'schema.rdf.org'. The page has a dark red header with the site name 'schema.rdf.org' in white. A navigation menu below the header includes 'Home', 'Learn', 'Tools', 'Mappings', 'FAQ', and 'About'. The main content area features a section titled 'What is Schema.RDFS.org?' followed by a paragraph explaining the site's purpose. Below this is a bulleted list of services provided. At the bottom, there are icons and labels for supported data formats: RDF/Turtle, RDF/XML, RDF/NTriples, JSON, and CSV.

## What is Schema.RDFS.org?

In early June 2011, the three big search engines Bing, Google and Yahoo! introduced [Schema.org](#), a collection of terms that webmasters can use to markup their pages to improve the display of search results. This site is a complementary effort by people from the Linked Data community to support Schema.org deployment and usage with a special focus on [Linked Data](#):

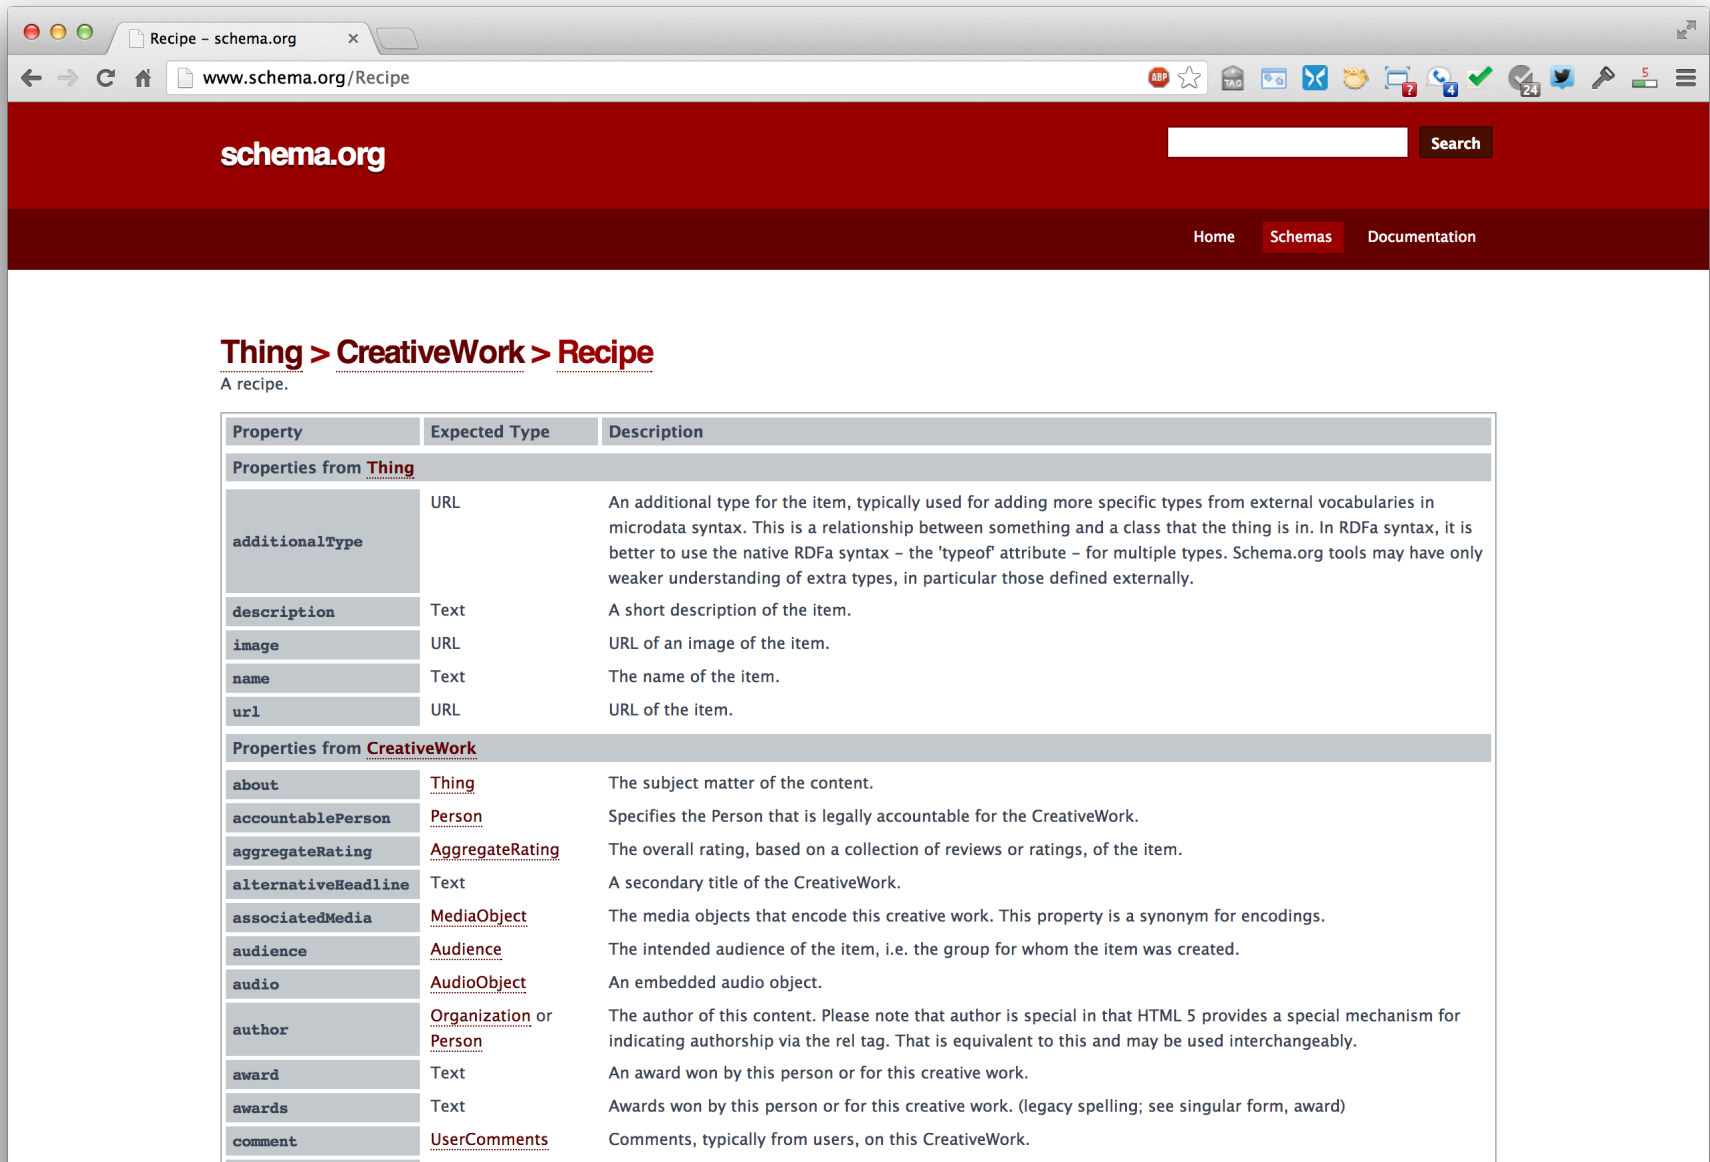

- We provide markup [examples](#) and [tutorials](#) about publishing & consuming data with Schema.org terms.
- We maintain [mappings](#) from Web Data vocabularies such as the [DBpedia ontology](#) to Schema.org terms.
- We list [tools](#) and libraries that are able to consume or produce Schema.org-based data.
- We automatically [scrape](#) the Schema.org terms on a daily basis and generate the following formats:

 [RDF/Turtle](#)     [RDF/XML](#)     [RDF/NTriples](#)

 [JSON](#)     [CSV: all classes, all properties](#)

Note that the official [OWL](#) version of the terms is directly maintained at Schema.org and independent from the above presented formats. Various [tools](#) that use or produce Schema.org terms are already available or in preparation. Stay tuned!

# <http://www.schema.org/Recipe>

The screenshot shows a web browser window with the URL [www.schema.org/Recipe](http://www.schema.org/Recipe). The page header includes the **schema.org** logo, a search bar, and navigation links for **Home**, **Schemas**, and **Documentation**. The main content area displays the class hierarchy: **Thing > CreativeWork > Recipe**, with a brief description: "A recipe."

Property	Expected Type	Description
<b>Properties from <a href="#">Thing</a></b>		
<a href="#">additionalType</a>	URL	An additional type for the item, typically used for adding more specific types from external vocabularies in microdata syntax. This is a relationship between something and a class that the thing is in. In RDFa syntax, it is better to use the native RDFa syntax - the 'typeof' attribute - for multiple types. Schema.org tools may have only weaker understanding of extra types, in particular those defined externally.
<a href="#">description</a>	Text	A short description of the item.
<a href="#">image</a>	URL	URL of an image of the item.
<a href="#">name</a>	Text	The name of the item.
<a href="#">url</a>	URL	URL of the item.
<b>Properties from <a href="#">CreativeWork</a></b>		
<a href="#">about</a>	<a href="#">Thing</a>	The subject matter of the content.
<a href="#">accountablePerson</a>	<a href="#">Person</a>	Specifies the Person that is legally accountable for the CreativeWork.
<a href="#">aggregateRating</a>	<a href="#">AggregateRating</a>	The overall rating, based on a collection of reviews or ratings, of the item.
<a href="#">alternativeHeadline</a>	Text	A secondary title of the CreativeWork.
<a href="#">associatedMedia</a>	<a href="#">MediaObject</a>	The media objects that encode this creative work. This property is a synonym for encodings.
<a href="#">audience</a>	<a href="#">Audience</a>	The intended audience of the item, i.e. the group for whom the item was created.
<a href="#">audio</a>	<a href="#">AudioObject</a>	An embedded audio object.
<a href="#">author</a>	<a href="#">Organization</a> or <a href="#">Person</a>	The author of this content. Please note that author is special in that HTML 5 provides a special mechanism for indicating authorship via the rel tag. That is equivalent to this and may be used interchangeably.
<a href="#">award</a>	Text	An award won by this person or for this creative work.
<a href="#">awards</a>	Text	Awards won by this person or for this creative work. (legacy spelling; see singular form, award)
<a href="#">comment</a>	<a href="#">UserComments</a>	Comments, typically from users, on this CreativeWork.

# Microdata as a KR language

- More than RDF, less than RDFS
- Properties have an *expected* type (range)
  - Might be a string
  - A list of types, any of which are OK
- Properties attached to one or more types (domain)
- Classes can have multiple parents and inherit (properties) from all of them
- No axioms (e.g., disjointness, cardinality, etc.)

# Mixing markup from other vocabularies

- Microdata is intended to work with one vocabulary – the one at [schema.org](http://schema.org)
- Advantages
  - Simple, organized, well designed
  - Controlled by the [schema.org](http://schema.org) people
- Disadvantages: too simple, controlled
  - Too simple, narrow, mono-lingual
  - Controlled by the [schema.org](http://schema.org) people

# Extending the schema.org ontology

- <http://www.schema.org/docs/extension.html>
- You can subclass existing classes
  - Person/Engineer
  - Person/Engineer/ElectricalEngineer
- Subclass existing properties
  - musicGroupMember/leadVocalist
  - musicGroupMember/leadGuitar1
  - musicGroupMember/leadGuitar2

# Extension Problems

- Do agreed upon meaning
  - Through axioms supported by the language (e.g., equivalence, disjointness, etc.)
  - No place for documentation (annotations, labels, comments)
- Without a namespace mechanism, your Person/Engineer and mine can be confused and might mean different things

# Conclusions

- Microdata is a good effort by the search companies to experiment with a simple semantic language
- It's not a great standard
- RDFa has a more powerful encoding and works with the RDF stack
- There's a bit of infighting in the WEB community
- RDFa Lite is maybe a good solution
