

Relational & Logical Operators, if and switch Statements

1

Topics

- Relational Operators and Expressions
- The if Statement
- The if-else Statement
- Nesting of if-else Statements
- switch
- Logical Operators and Expressions
- Truth Tables

2

Relational Operators

<	less than
>	greater than
<=	less than or equal to
>=	greater than or equal to
==	is equal to
!=	is not equal to

- Relational expressions evaluate to true or false.
- All of these operators are called binary operators because they take two expressions as operands.

3

Practice with Relational Expressions

var a = 1, b = 2, c = 3 ;

<u>Expression</u>	<u>true/false</u>	<u>Expression</u>	<u>true/false</u>
a < c		a + b >= c	
b <= c		a + b == c	
c <= a		a != b	
a > b		a + b != c	
b >= c			

4

Arithmetic Expressions: True or False

- Arithmetic expressions evaluate to numeric values.
- An arithmetic expression that has a value of zero is false.
- An arithmetic expression that has a value other than zero is true.

5

Practice with Arithmetic Expressions

var a = 1, b = 2, c = 3 ;
var x = 3.33, y = 6.66 ;

<u>Expression</u>	<u>Numeric Value</u>	<u>True/False</u>
a + b		
b - 2 * a		
c - b - a		
c - a		
y - x		
y - 2 * x		

6

Review: Structured Programming

- All programs can be written in terms of only three control structures
 - The **sequence** structure
 - Unless otherwise directed, the statements are executed in the order in which they are written.
 - The **selection** structure
 - Used to choose among alternative courses of action.
 - The **repetition** structure
 - Allows an action to be repeated while some condition remains true.

7

Selection: the if statement

```
if( condition )
{
    statement(s) // body of if statement
}
```

- The braces are not required if the body contains only a single statement. However, they are a good idea and are required by the 104 C Coding Standards.

8

Examples

```
if(age >= 18)
{
    alert("Go Vote!");
}

if(value == 0)
{
    alert("You entered zero.");
}
```

9

Alert Screenshot

```
<script type="text/javascript">
<!--
var age = 18;

if (age >= 18)
{
    alert("Go Vote!");
}
//-->
</script>
```

10

Good Programming Practice

- Always place braces around the body of an if statement.
- Advantages:
 - Easier to read
 - Will not forget to add the braces if you go back and add a second statement to the body
 - Less likely to make a semantic error
- Indent the body of the if statement 2 to 3 spaces -- be consistent!

11

Selection: the if-else statement

```
if( condition )
{
    statement(s) /* the if clause */
}
else
{
    statement(s) /* the else clause */
}
```

- Note that there is no condition for the else.

12

Example

```
if(age >= 18)
{
    alert("Go Vote!");
}
else
{
    alert("Maybe next time!");
}
```

13

Another Example

```
if(value == 0)
{
    alert("You entered zero.");
}
else
{
    alert("Value = " + value);
}
```

14

Good Programming Practice

- Always place braces around the bodies of the if and else clauses of an if-else statement.
- Advantages:
 - Easier to read
 - Will not forget to add the braces if you go back and add a second statement to the clause
 - Less likely to make a semantic error
- Indent the bodies of the if and else clauses 2 to 3 spaces -- be consistent!

15

Nesting of if-else Statements

```
if(condition1)
{
    statement(s)
}
else if(condition2)
{
    statement(s)
}
. . . /* more else if clauses may be here */
else
{
    statement(s) /* the default case */
}
```

16

Another Example

```
if(value == 0)
{
    alert("You entered zero.");
}
else if(value < 0)
{
    alert(value + " is negative.");
}
else
{
    alert(value + " is positive.");
}
```

17

Gotcha! = versus ==

```
var a = 2;
if(a = 1) /* semantic (logic) error! */
{
    alert("a is one");
}
else if(a == 2)
{
    alert("a is two");
}
else
{
    alert("a is " + a);
}
```

18

Gotcha! = versus ==

- The statement `if (a = 1)` is syntactically correct, so no error message will be produced. However, a semantic (logic) error will occur.
- An assignment expression has a value -- the value being assigned. In this case the value being assigned is 1, which is true.
- If the value being assigned was 0, then the expression would evaluate to 0, which is false.
- This is a VERY common error. So, if your if-else structure always executes the same, look for this typographical error.

19

Multiple Selection with if

(continued)

```
if (day == 0) {
    alert("Sunday");
}
if (day == 1) {
    alert("Monday");
}
if (day == 2) {
    alert("Tuesday");
}
if (day == 3) {
    alert("Wednesday");
}
if (day == 4) {
    alert("Thursday");
}
if (day == 5) {
    alert("Friday");
}
if (day == 6) {
    alert("Saturday");
}
if ((day < 0) || (day > 6)) {
    alert("Error - invalid day.");
}
```

20

Multiple Selection with if-else

```
if (day == 0) {
    alert("Sunday");
} else if (day == 1) {
    alert("Monday");
} else if (day == 2) {
    alert("Tuesday");
} else if (day == 3) {
    alert("Wednesday");
} else if (day == 4) {
    alert("Thursday");
} else if (day == 5) {
    alert("Friday");
} else if (day == 6) {
    alert("Saturday");
} else {
    alert("Error - invalid day.");
}
```

This if-else structure is more efficient than the corresponding if structure. Why?

21

The switch Multiple-Selection Structure

```
switch ( expression )
{
    case value1 :
        statement(s)
        break ;
    case value2 :
        statement(s)
        break ;
    . . .
    default:
        statement(s)
        break ;
}
```

22

switch Example

```
switch (day)
{
    case 0: alert("Sunday");
            break ;
    case 1: alert("Monday");
            break ;
    case 2: alert("Tuesday");
            break ;
    case 3: alert("Wednesday");
            break ;
    case 4: alert("Thursday");
            break ;
    case 5: alert("Friday");
            break ;
    case 6: alert("Saturday");
            break ;
    default: alert("Error -- invalid day.");
            break ;
}
```

Is this structure more efficient than the equivalent nested if-else structure?

23

switch Statement Details

- The last statement of each case in the switch should *almost* always be a break.
- The break causes program control to jump to the closing brace of the switch structure.
- Without the break, the code flows into the next case. This is almost never what you want.
- A switch statement will work without a default case, but always consider using one.

24

Good Programming Practices

- Include a default case to catch invalid data.
- Inform the user of the type of error that has occurred (e.g., "Error - invalid day.").
- If appropriate, display the invalid value.
- If appropriate, terminate program execution (discussed in CMSC 201).

25

Why Use a switch Statement?

- A switch statement can be more efficient than an if-else.
- A switch statement may also be easier to read.
- Also, it is easier to add new cases to a switch statement than to a nested if-else structure.

26

Logical Operators

- So far we have seen only simple conditions.
`if (count > 10) ...`
- Sometimes we need to test multiple conditions in order to make a decision.
- Logical operators are used for combining simple conditions to make complex conditions.

`&&` is AND `if (x > 5 && y < 6)`

`||` is OR `if (z == 0 || x > 10)`

`!` is NOT `if (!(bob > 42))`

27

Example Use of &&

```
if ( age < 1 && gender == "f" )
{
    alert ( "You have a baby girl!" );
}
```

28

Truth Table for &&

<u>Expression₁</u>	<u>Expression₂</u>	<u>Expression₁ && Expression₂</u>
0	0	0
0	nonzero	0
nonzero	0	0
nonzero	nonzero	1

`Exp1 && Exp2 && ... && Expn` will evaluate to 1 (true) only if ALL **subconditions** are true.

29

Example Use of ||

```
if ( grade == "D" || grade == "F" )
{
    alert ( "See you next semester!" );
}
```

30

Truth Table for ||

<u>Expression₁</u>	<u>Expression₂</u>	<u>Expression₁ Expression₂</u>
0	0	0
0	nonzero	1
nonzero	0	1
nonzero	nonzero	1

Exp₁ && Exp₂ && ... && Exp_n will evaluate to 1 (true) if only ONE subcondition is true.

31

Example Use of !

```
if(!(age >= 18)) /*same as (age < 18)*/
{
    alert("Sorry, you can't vote.");
}
else
{
    alert("You can vote.");
}
```

32

Truth Table for !

<u>Expression</u>	<u>!Expression</u>
0	1
nonzero	0

33

Operator Precedence and Associativity

<u>Precedence</u>	<u>Associativity</u>
()	left to right/inside-out
* / %	left to right
+ (addition) - (subtraction)	left to right
< <= > >=	left to right
== !=	left to right
&&	left to right
	left to right
=	right to left

34

Some Practice Expressions

```
var a = 1, b = 0, c = 7;
```

<u>Expression</u>	<u>True/False</u>
a	
b	
a + b	
a && b	
a b	
!c	
!!c	
a && !b	
a < b && b < c	
a > b && b < c	
a >= b b > c	

35

More Practice

- Given
var a = 3, b = 7, c = 21 ;

evaluate each expression as true or false.

- c / b == 2
- c % b <= a % b
- b + c / a != c - a
- (b < c) && (c == 7)
- (c + 1 - b == 0) || (b = 5)

36
