Red-Black Trees

Definitions

and

Bottom-Up Insertion
Red-Black Trees

• **Definition:** A red-black tree is a binary search tree in which:
  – Every node is either Red or Black.
  – Each NULL pointer is considered to be a Black “node”.
  – If a node is Red, then both of its children are Black.
  – Every path from a node to a NULL contains the same number of Black nodes.
  – The root is Black

• **Definition:** The black-height of a node, X, in a red-black tree is the number of Black nodes on any path to a NULL, not counting X.
A Red-Black Tree with NULLs shown

Black-Height of the tree (the root) = 3
Black-Height of node “X” = 2
A Red-Black Tree with
Black-Height = 3
Theorem 1 – Any red-black tree with root $x$, has $n \geq 2^{bh(x)} - 1$ nodes, where $bh(x)$ is the black height of node $x$.

Proof: by induction on height of $x$. 
Theorem 2 – In a red-black tree, at least half the nodes on any path from the root to a NULL must be Black.

Proof – If there is a Red node on the path, there must be a corresponding Black node.

Algebraically this theorem mean
\[ bh(x) \geq h/2 \]
Theorem 3 – In a red-black tree, no path from any node, X, to a NULL is more than twice as long as any other path from X to any other NULL.

Proof: By definition, every path from a node to any NULL contains the same number of Black nodes. By Theorem 2, at least $\frac{1}{2}$ the nodes on any such path are Black. Therefore, there can no more than twice as many nodes on any path from X to a NULL as on any other path. Therefore the length of every path is no more than twice as long as any other path.
Theorem 4 –

A red-black tree with \( n \) nodes has height
\[
h \leq 2 \ lg(n + 1).
\]

Proof: Let \( h \) be the height of the red-black tree with root \( x \). By Theorem 2,
\[
bh(x) \geq h/2
\]
From Theorem 1, \( n \geq 2^{bh(x)} - 1 \)

Therefore \( n \geq 2^{\frac{h}{2}} - 1 \)
\[
n + 1 \geq 2^{\frac{h}{2}}
\]
\[
lg(n + 1) \geq h/2
\]
\[
2\lg(n + 1) \geq h
\]
Bottom –Up Insertion

• Insert node as usual in BST
• Color the Node Red
• What Red-Black property may be violated?
  – Every node is Red or Black
  – NULLs are Black
  – If node is Red, both children must be Black
  – Every path from node to descendant NULL must contain the same number of Blacks
Bottom Up Insertion

- Insert node; Color it Red; X is pointer to it
- Cases
  0: X is the root -- color it Black
  1: Both parent and uncle are Red -- color parent and uncle Black, color grandparent Red, point X to grandparent, check new situation
  2 (zig-zag): Parent is Red, but uncle is Black. X and its parent are opposite type children -- color grandparent Red, color X Black, rotate left(right) on parent, rotate right(left) on grandparent
  3 (zig-zig): Parent is Red, but uncle is Black. X and its parent are both left (right) children -- color parent Black, color grandparent Red, rotate right(left) on grandparent
Case 1 – U is Red
Just Recolor and move up
Case 2 – Zig-Zag

Double Rotate
  X around P; X around G

Recolor G and X
Case 3 – Zig-Zig
Single Rotate P around G
Recolor P and G
Insert 4 into this R-B Tree
Insertion Practice

Insert the values 2, 1, 4, 5, 9, 3, 6, 7 into an initially empty Red-Black Tree
Asymptotic Cost of Insertion

- $O(\lg n)$ to descend to insertion point
- $O(1)$ to do insertion
- $O(\lg n)$ to ascend and readjust — worst case only for case 1

- Total: $O(\log n)$
