CMSC 471 Pretest
Thursday, September 1, 2011
DUE: Thursday, September 8, 2011

You may use written reference materials. You may not work on or discuss the pretest with anyone else. You will receive 10 points of extra credit on your first homework for turning in the completed pretest on time. The score on the pretest will not affect the homework points that you receive; your score is primarily to assess your knowledge of prerequisite material that you are expected to know for CMSC 471. If you have trouble with this pretest, you may want to put in some time now reviewing basic concepts.

Please attach separate pages with your answers.

Previous Coursework

Please fill in with your previous coursework. (Not all of these courses are prerequisites for CMSC 471, so you may not have taken all of them. That’s fine: just indicate “N/A” for courses you haven’t taken.)

1 Logic (20 pts)

Represent the following sentences in first-order logical notation. Use the following predicates (you may also use = and ≠):

- \( \text{likes}(x,y) \) – \( x \) likes \( y \)
- \( \text{student}(x) \) – \( x \) is a student
- \( \text{grade}(x,y,c) \) – \( x \) receives grade \( y \) in course \( c \)
- \( \text{person}(x) \) – \( x \) is a person
- \( \text{study}(x,c) \) – \( x \) studies for course \( c \)

1. Everybody likes Raymond.
2. At least one student will get an A.
3. At least two students will get a B.
4. If a student studies for a course, they will get an A or a B in that course.
5. If a student doesn’t study for a course, they will get a C, D, or F in that course.
2 Combinatorics (15 pts)

For an alphabet with $N$ symbols, how many words are there of length $k$ or less? (The symbols in the alphabet are just the letters, and the words are the strings that you can make from those symbols. So an alphabet with one symbol, $X$, has three words of length 2 or less: the empty word ($\lambda$), the word $X$, and the word $XX$. Hint: Your answer should use summation notation.)

3 Algorithm Design and Programming Principles (25 pts)

Write a function $\text{Words}$ in pseudocode that accepts at least two arguments: an alphabet $\text{alph}$ (represented as an array of $N$ symbols), and a word length $k$ (represented as a positive integer). The function should print a list of all of the words of length $\text{len}$ (using the symbols in the alphabet), in alphabetical order. You will most likely want to include additional arguments for the recursion; deciding what to add is part of the exercise.

4 Algorithmic Complexity (15 pts)

What is the “big-O” complexity of the function in Section 3, in terms of $N$ and $k$? Justify your answer.

5 Probability and Statistics (25 pts)

1. Suppose that you are given three unbiased six-sided dice. (In case you’re not familiar with the term: “unbiased” just means that each side has an equal probability (i.e., $1/6$) of being rolled.) What is the probability of rolling a 10 (i.e., that the total of the three dice is equal to ten)? Show your work.

2. Now suppose that one of the dice is biased, so that it shows a 1 half of the time, and a 2 half of the time. (It never rolls a 3, 4, 5, or 6.) What is the probability of rolling a 10? Show your work.
